

Welcome to

Git/Github Basics

2020

Henrik Kramselund Jereminsen hkj@zencurity.com @kramse

Slides are available as PDF, kramse@Github git-github.tex in the repo security-courses

slides are available on Github

Goal for today

- Plan:
- Approx 2h including break
- Inspiration for using Git in your life
- Not an expert in Git

My daily job - Security engineering a job role

On any given day, you may be challenged to:

Create new ways to solve existing production security issues

Configure and install firewalls and intrusion detection systems

Perform vulnerability testing, risk analyses and security assessments

Develop automation scripts to handle and track incidents

Investigate intrusion incidents, conduct forensic investigations and incident responses

Collaborate with colleagues on authentication, authorization and encryption solutions

Evaluate new technologies and processes that enhance security capabilities

Test security solutions using industry standard analysis criteria

Deliver technical reports and formal papers on test findings

Respond to information security issues during each stage of a project's lifecycle

Supervise changes in software, hardware, facilities, telecommunications and user needs

Define, implement and maintain corporate security policies

Analyze and advise on new security technologies and program conformance

Recommend modifications in legal, technical and regulatory areas that affect IT security

Source: https://www.cyberdegrees.org/jobs/security-engineer/also https://en.wikipedia.org/wiki/Security_engineering

So I am *not a developer*

What is asset management

CIS Control 1:

Inventory and Control of Hardware Assets Actively manage (inventory, track, and correct) all hardware devices on the network so that only authorized devices are given access, and unauthorized and unmanaged devices are found and prevented from gaining access.

Source: https://www.cisecurity.org/

- Hardware bought, connected, loaners, stolen ...
- Software licenses, procurement, upgrades are cheaper if you have earlier versions
- Virtual assets business critical data
- ...

Configuration: TLS and VPN settings

```
# Input from https://github.com/tykling/ansible-roles/blob/master/nginx server/templates/tls.conf.j2#L6
                                  TLSv1.2 TLSv1.3:
 ssl protocols
 ssl ciphers
                                  ECDHE-RSA-AES256-GCM-SHA384: ECDHE-RSA-CHACHA20-POLY1305: ECDHE-RSA-AES128-GCM-SHA256: ECDHE-RSA-
AES256-SHA384: ECDHE-RSA-AES128-SHA256: ECDHE-RSA-AES256-SHA:
 ssl prefer server ciphers
                                  on;
 ssl session cache
                                  shared:SSL:10m;
                                                      ssl session tickets
                                                                                off;
                                                                                        ssl session timeout
                                                                                                               4h:
                                                      ssl stapling verify
 ssl stapling
                                  on;
                                                                                 on;
 resolver
                                  105.238.53.1;
 ssl ecdh curve secp384r1;
                                                      ssl dhparam /etc/nginx/dh4096.pem;
 add_header Strict-Transport-Security "max-age=31536000; includeSubDomains" always;
 add header Referrer-Policy "no-referrer"; add header X-Content-Type-Options "nosniff";
 add header X-Frame-Options "DENY"; add header X-XSS-Protection "1; mode=block";
 add header Content-Security-Policy "default-src 'self'; script-src 'self; img-src 'self'; object-src 'none'; font-src 'self'; fram
ancestors 'none' https:";
```

- Most have web sites with TLS/HTTPS how is it configured
- Recommend centralizing and going over settings regularly
- Create a policy for your organisation

Where do we store this information?

Ansible

From my course materials:

Ansible is great for automating stuff, so by running the playbooks we can get a whole lot of programs installed, files modified - avoiding the Vi editor.

- Easy to read, even if you don't know much about YAML
- https://www.ansible.com/ and https://en.wikipedia.org/wiki/Ansible_(software)
- Great documentation https://docs.ansible.com/ansible/latest/collections/ansible/builtin/apt_module.html

Ansible Dependencies

- Ansible based on Python, only need Python installed https://www.python.org/
- Often you use Secure Shell for connecting to servers https://www.openssh.com/
- Easy to configure SSH keys, for secure connections

Ansible playbooks

Example playbook content, installing software using APT:

```
apt:
    name: "{{ packages }}"
    vars:
        packages:
        - nmap
        - curl
        - iperf
        ...
```

Running it:

```
cd kramse-labs/suricatazeek
ansible-playbook -v 1-dependencies.yml 2-suricatazeek.yml 3-elasticstack.yml
```

"YAML (a recursive acronym for "YAML Ain't Markup Language") is a human-readable data-serialization language." https://en.wikipedia.org/wiki/YAML

Python and YAML - Git

- We need to store configurations
- Run playbooks
- Problem: Remember what we did, when, how
- Solution: use git for the playbooks
- Not the only version control system, but my preferred one

Alternative

Download and install the public signing key:
wget -q0 - https://artifacts.elastic.co/GPG-KEY-elasticsearch sudo apt-k
Installing from the APT repository You may need to install the apt-transport-https package on Debian before proceeding:
sudo apt-get install apt-transport-https
Save the repository definition to /etc/apt/sources.list.d/elastic-7.x.list:
echo "deb https://artifacts.elastic.co/packages/7.x/apt stable main" suc

My playbooks allow installation of a whole Elastic stack in less then 10 minutes,

compare to:

Getting started with the Elastic Stack

https://www.elastic.co/guide/en/elastic-stack-get-started/current/get-started-elastic-stack.html

Git getting started

Hints:

Browse the Git tutorials on https://git-scm.com/docs/gittutorial and https://guides.github.com/activities/hello-world/

- What is git
- Terminology

Note: you don't need an account on Github to download/clone repositories, but having an account allows you to save repositories yourself and is recommended.

Demo: Ansible, Python, Git!

Running Git will allow you to clone repositories from others easily. This is a great way to get new software packages, and share your own.

Git is the name of the tool, and Github is a popular site for hosting git repositories.

- Go to https://github.com/kramse/
- Lets explore while we talk
- Hint; getting the presentation from today might be a task

Demo: output from running a git clone

```
user@Projects:tt$ git clone https://github.com/kramse/kramse-labs.git
Cloning into 'kramse-labs'...
remote: Enumerating objects: 283, done.
remote: Total 283 (delta 0), reused 0 (delta 0), pack-reused 283
Receiving objects: 100% (283/283), 215.04 KiB | 898.00 KiB/s, done.
Resolving deltas: 100% (145/145), done.

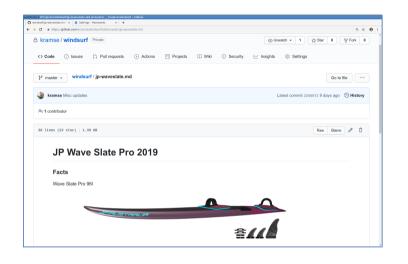

user@Projects:tt$ cd kramse-labs/

user@Projects:kramse-labs$ is
LICENSE README.md core-net-lab lab-network suricatazeek work-station
user@Projects:kramse-labs$ git pull
Already up to date.
```

for reference at home later

Sample Project: Windsurf Inventory

- Simple example of using Git, saving some files, and update them
- Problem: Windsurfing equipment and technical details
- Many sources, JP Board, Niel Pryde Sails, Unifiber masts, ...
- Solution: Markdown and Git
- Sorry this repo is closed, you cannot browse it

Sample Project: Presentations

- Problem: Create reusable presentations, allow students to get latest version
- Multiple files, many updates over the years
- Wants: Get PDF output
- Solution: LaTeX and Git
- https://en.wikipedia.org/wiki/LaTeX
- Look at the file: first-presentation.pdf from https://github.com/kramse/security-courses

Git remote

- Git repositories are basically files
- Git repos allow you to clone, download files git clone
- Work locally, including making brances
- Integrate/upload/merge into remote repositories git commit and git push
- Git doesn't care if you are one person with multiple laptops, or multiple persons

Git configuration: user information

```
File: .gitconfig

[user]
  name = Henrik Kramselund Jereminsen
  email = hkj@kramse.org

[push]
  default = simple
```

- There is a small amount of configuration, user information
- Each repository also has a gitignore

Git configuration: ignore files

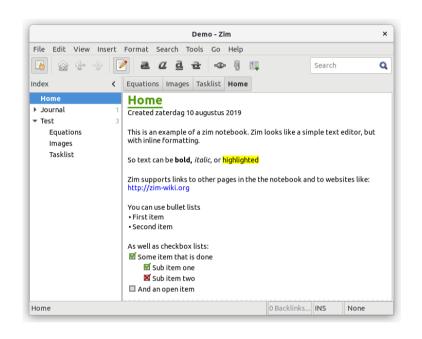

File: .gitignore top of repository

```
# OS generated files
.DS_Store
.Spotlight-V100
.Trashes
# Latex files
*.aux
*.idx
*.log
*.toc
*.ind
*.out
*.synctex.gz
*.fls
*.fdb_latexmk
```

• Each repository also has a .gitignore, part shown above

Example: Zim Personal Wiki

- My personal ToDo list is using Zim backed by Git repository
- https://zim-wiki.org/

Github bragging

Suricata » Suricata Developers Guide »

Contributing This guide describes what steps to take if you want to contribute a patch or patchset to Suricata. Before you start, please review and sign our Contribution Agreement

. . .

Create your own branch It's useful to create descriptive branch names. If you're working on ticket 123 to improve GeoIP? Name your branch "geoip-feature-123-v1". The -v1"addition for feedback. When incorporating feedback you will have to create a new branch for each pull request. So when you address the first feedback, you will work in "geoip-feature-123-v2" and so on. Github: Creating a branch with Github Git: Creating a branch with Git
